6.	Document Control Procedure	10
7.	Internal Audit Procedure	11
8.	Management Review Procedure	12
9.	Continuous Improvement Procedure	13

1. Quality Policy

At Example Ltd, quality is embedded in every part of our day-to-day operations. Our overriding goal is for every mechanical and electrical installation to meet contractual requirements, be delivered safely, and pass all compliance inspections upon first submission. We do not consider a project complete until all test certificates and commissioning records are signed and handed over as a coherent package, reflecting our commitment to traceability and legal compliance throughout.

We work predominantly on live, operational sites such as schools, NHS facilities, and offices, where our activities have a direct impact on building users and other contractors. We understand that missing programme dates on these sites is not just inconvenient; it causes significant disruption. To prevent this, we coordinate start dates and material requirements with main contractors from the outset, agreeing clear deadlines and delivering on them.

Quality, for us, also means all handovers are snag-free from the perspective of the main contractor — we systematically address issues during final checks and are committed to resolving identified defects swiftly, without protracted site revisits. Operatives are briefed at the outset of each phase to ensure everyone knows the standards required and the importance of accurate documentation.

Our record-keeping and certification practices are central to our approach. Electrical installations are tested to BS 7671, and paperwork is checked by the responsible team member before it is formally closed out. We ensure that all test and commissioning records are completed promptly, not left to the end, with signatures from authorised personnel. By consistently following this approach, we maintain productive relationships with our clients and safeguard our reputation as a reliable partner that does not cause delays or compliance headaches.

2. Quality Objectives

QUALITY OBJECTIVES BY END OF 2026

Jobs completed to agreed programme date

80 %

95 %

Snagging items raised at handover

20

10 per job avg

Commissioning/test packs fully completed at handover

60 %

100 %

Our quality objectives focus on measurable improvements in programme delivery, defect reduction, and documentation standards. First, we aim to increase the proportion of jobs completed by the contractual date from the current 80% to 95% by the end of 2026. To monitor this, we maintain a project register where site completion and handover dates are logged, with monthly reviews led by the managing director and office manager.

Second, we target a reduction in snagging items noted at handover from an average of 20 per job to 10 or fewer by the end of 2026. Each project's snagging list is analysed to identify recurring issues, informing toolbox talks and procedural adjustments led by the site manager.

Third, we commit to achieving 100% timely completion and handover of commissioning and test packs (up from the current 60% on time), also by end of 2026. Completion status is checked at each key handover stage, and any gaps are flagged in weekly progress updates. These objectives are reviewed biannually as part of the management review, with corrective actions initiated where there is slippage against target.

3. Scope of the Quality Management System

Our quality management system applies to the installation and maintenance of mechanical and electrical systems in commercial and public-sector buildings in the West Midlands, including schools, NHS facilities, office developments, and light industrial units. The system covers all phases from tender through to completion, including procurement, site execution, documentation, and aftercare. New installations, servicing, and remedial works are included, whether delivered directly for public clients or as a subcontractor to principal contractors. All personnel, subcontractors, and temporary staff engaged on these scopes are subject to the system's processes. The requirements and boundaries of this manual extend to all operational sites in line with contract obligations and relevant statutory, regulatory (CDM, BS 7671, Gas Safe, CSCS/ECS), and client-imposed standards.

4. Process Overview

Our processes are structured to ensure that leadership, operational, and supporting activities form an integrated framework. Leadership processes focus on strategic alignment, resource allocation, and oversight. Core processes govern how projects are delivered on the ground, from bidding to handover. Support processes ensure tools, people, and systems are in place and compliant, underpinning both productive work and compliance with our contractual and statutory obligations.

4.1 Leadership Processes

Leadership is exercised primarily through clear project planning, review sessions, and escalation of non-conformities. Gareth Pryce, Owner / Managing Director, initiates a formal management review each spring, triggered by a review of jobs completed in the previous 12 months and analysis of performance against our three main KPIs. At this session, delivery rates, documentation completion, and snagging trends are scrutinised using actual figures drawn from the project register and handover records.

During these management reviews, Gareth leads the setting of revised targets and agrees practical actions to address any shortfalls. For example, if job completion rates are below target, Gareth questions the causes with both office and site management, and actions are assigned and tracked via the central action log.

Strategic supplier issues and operational resource gaps are discussed in monthly leadership meetings, attended by the office manager, site manager, and plant controller. If a consistent pattern of delayed materials undermines quality or deadlines, Gareth escalates the issue directly with the supplier or authorises switching to an alternative. In cases of compliance lapses (e.g., expired certificates or safety cards), immediate suspension of the affected activity is triggered until corrective actions are signed off.

Deviations such as repeated snagging or documentation shortfalls are addressed by directing the responsible site or office manager to review existing processes and propose practical improvements. These are logged, assigned an owner, and their effect is tracked at the next management review. All of these controls ensure that leadership is directly involved and interventions are rapid and effective.

4.2 Core Processes

Project delivery begins once a contract or order is secured. The process is triggered by a handover from the tendering (usually Gareth or Joanne) to planning. Pre-start meetings involve Lee Hammond, Site Manager, and Joanne Clarke, Office Manager. They review the client's requirements, detailed programme, materials schedules, and site-specific RAMS (Risk Assessments and Method Statements).

Joanne coordinates materials and plant procurement immediately following the materials schedule agreed with Lee, ensuring lead times allow for inspection before works commence. Confirmation of delivery dates is communicated to Lee, who uses this information to plan crew mobilisation and avoid delays on site. Once the crew is mobilised, Lee delivers an operational briefing to all operatives, underlining programme milestones, quality expectations (including BS 7671 compliance for electrical works), and documentation requirements.

Works progress through clear stages: first-fix, second-fix, and final-fix. Lee supervises quality and progress at each stage, undertaking checks against drawings and specifications. All electrical installation work is tested in accordance with BS 7671, using calibrated test equipment. Mechanical installation is commissioned following manufacturers' and client procedures, and all data is entered into the commissioning/test pack as the works progress. Completion of these records is not deferred — Joanne tracks outstanding items weekly via the project management software and flags missing signatures or paperwork for immediate action.

Prior to handover, Lee leads a snagging walkthrough, aiming to pre-empt external snagging lists. Any defects noted are rectified immediately by the on-site crew. Upon resolving final snags, Joanne collates all test certificates, commissioning records, and O&M information into the final documentation pack. Only when Gareth reviews and signs off this pack is the project considered ready for formal handover to the client or main contractor.

Any issues identified after completion (such as defects or client complaints) follow a separate non-conformance and corrective action process: Joanne logs the issue, Lee investigates and recommends remedial action, and Gareth signs off closure once the problem is resolved and process changes (if required) are agreed.

4.3 Support Processes

Supporting activities ensure the core operational processes run without interruption and in compliance with legal and client standards. Joanne Clarke manages all document control, including versions of drawings, test certificates, and site instructions. When a revised drawing or spec is issued, Joanne checks the version, logs it in the control register, and ensures Lee has the correct issue for the site. Only released, controlled documents are circulated to crews, and all obsolete copies are removed. At each project milestone, completed certificates and records are scanned and securely stored, preventing misplaced paperwork at handover.

Purchasing and supplier management is handled operationally. Joanne raises orders based on schedules from Lee and checks delivery notes against orders on arrival to catch incomplete or incorrect deliveries immediately, flagging issues back to suppliers for prompt resolution. Ricky Obeng oversees checks on received plant and ensures all electrical test equipment and pipe pressure testers are within calibration — using a simple register updated upon each annual calibration certificate received from the external house. Recordkeeping is electronic, but physical certificates are also retained in the main office for audit.

Joanne also manages the main trade software package, entering jobs, quotes, and invoicing data, and making sure every project is properly set up from the outset. New operatives and apprentices are onboarded together by Lee and Ricky, who verify that all ECS, CSCS or Gas Safe cards (as relevant) are in date prior to site access. Ricky keeps a master register of operative qualifications, highlighting renewal dates. He tracks expiries proactively and flags to both the operative and Lee in advance; anyone with expired cards or tickets is not allowed on site until renewal evidence is provided.

The company ensures all site staff receive a briefing on health and safety, client standards, and documentation practice during induction, with ongoing toolbox talks scheduled for recurring issues. All waste carriers are pre-approved and checked for valid waste carrier licensing.

5. Roles and Responsibilities

Leadership within Example Ltd is provided by Gareth Pryce, Owner and Managing Director. Gareth oversees company strategy, leads management reviews, and sets and monitors quality objectives. Gareth is directly involved in every project at the handover and completion stages, personally reviewing documentation packs before client submission and making the call on immediate escalation of any serious issues around quality, safety, or programme.

The Site Manager, Lee Hammond, is responsible for operational execution on site. He leads all site crews, delivers briefings, ensures work is completed to drawing/specification, and manages both daily and milestone quality checks. Lee documents crew attendance, approves sign-off stages (first-fix to final-fix), leads snagging walks, and ensures on-site issues are raised promptly for investigation.

The Office Manager, Joanne Clarke, is responsible for procurement of all materials and plant, document issuing and control, and administration of the main project software. Joanne checks that materials orders match the schedule and are delivered as required, logs and chases non-conformities in deliveries, and controls the flow of documentation between office and site. She is the primary administrator for project records and is responsible for logging new issues, assigning actions, and tracking them through to closure.

Ricky Obeng, Plant and Equipment Controller, manages all company tools, plant, and test equipment. He keeps the calibration log up to date, books annual calibrations with the selected laboratory, and tags any equipment with expired certification as out-of-service. Ricky maintains the register of CSCS/ECS/Gas Safe cards and proactively monitors expiry, contacting operatives and management in good time for renewals.

Responsibilities for quality management are currently distributed, with Gareth Pryce acting as the de facto Quality Manager by leading management reviews and overseeing process improvements, documentation, and compliance activities. All staff are responsible for highlighting potential issues and non-conformities through the mechanisms defined in this manual.

6. Document Control Procedure

Document control begins when new contract documents, specifications, drawings, or procedures are received or created. Joanne reviews each for completeness and revision status, enters it into the electronic register, and labels it with the date and revision number. Only the latest approved revision is issued to site, and older copies are marked obsolete and physically removed where practical.

Electronic project files are secured by restricted login. Access is given to operational staff with responsibility for the project; all others must request access via Joanne. When an external party, such as a main contractor or framework client, issues revised information, the new documents are immediately identified and superseded versions removed from active use.

All completed records, including test certificates, commissioning data, and O&M manuals, are scanned (if paper copies are used), filed in the central project folder, and retained a minimum of 6 years or as contractually required. At handover, the documentation pack is checked for completeness by both Joanne and Gareth.

When a document is updated, Joanne notifies all relevant staff and confirms receipt/acknowledgment prior to use on site. Any staff member finding an error or discrepancy in a document is required to inform Joanne, who investigates, corrects, and issues a revised controlled document as required.

7. Internal Audit Procedure

Internal audits are planned and carried out at least once per year, typically at the end of the spring as part of preparation for the management review. The audit schedule is determined by Gareth, taking into account areas of risk identified over the preceding review period (e.g., any documentation or delivery failures).

Audits are conducted by a person independent of the immediate activity — usually Joanne audits site processes (with support from Gareth if needed), and operational documentation is checked by Ricky or Lee, depending on the subject. Audits include site walk-throughs, document sampling, verification of certificate records (including BS 7671 test results and calibration logs), and interviews with staff involved in recent projects.

Findings are recorded in an internal audit log, highlighting both compliance and any issues requiring corrective action. Each non-conformity is assigned an owner, actions are agreed with specific completion dates, and progress is tracked by Joanne. Major findings are flagged for discussion at the management review and may prompt an immediate update to procedures.

If repeat or high-severity issues are detected, Gareth assigns cross-checks or additional audits to verify effective remediation. Once all actions are closed, the audit is formally signed off and lessons are shared at the next company meeting.

8. Management Review Procedure

The management review takes place every six to twelve months, with timing typically aligned to workload cycles (usually late spring or early autumn). Gareth initiates the process by requesting up-to-date figures for the three core KPIs: programme delivery, snagging rates, and documentation completion.

Attendees include Gareth, Lee, Joanne, and Ricky. Each provides a summary of recent issues, completed actions, lessons learnt, and areas where improvements or resource changes may be required. Key agenda items include:

- progress against quality objectives
- audit findings and their closure status
- risk/opportunity analysis based on recent project experiences
- review of supplier and subcontractor performance
- changes to compliance obligations (e.g., updates to BS 7671 or Gas Safe)
- training and competence needs

Any deviations from targets or repeated process failures are discussed, and corrective actions with designated owners and deadlines are agreed. The meeting minutes include a formal list of actions, signed off by Gareth and re-checked at the start of the next review cycle.

If there is a significant change in operations, client requirements, standards, or legislation (such as a new edition of BS 7671), an unscheduled management review may be convened by Gareth to address immediate risk or compliance gaps.

9. Continuous Improvement Procedure

Continuous improvement is embedded in everyday operations and formal review. The process is triggered by any non-conformity, recurring snagging item, audit finding, or feedback from clients, site operatives, or main contractors.

Joanne logs all reported issues and suggestions for improvement in a dedicated register. Lee investigates operational or site-based issues, recommends root cause actions, and brings these to the weekly coordination meeting. Where repeated problems or suggestions highlight underlying process gaps (e.g., materials not arriving on time, test certificates not completed promptly), the management team analyses the data and engages the wider team in brainstorming solutions.

Gareth oversees the implementation of corrective and preventive actions. Agreed changes — whether a revised procurement step, updated document format, or new training module — are recorded in the action log, issued to staff in writing, and progress is tracked at both weekly and management review meetings.

Improvements are measured by their impact on key objectives: fewer snags, better on-time delivery, and improved documentation quality. If a process change is unsuccessful, it is re-evaluated, and further corrective action taken. Staff are encouraged to raise improvement ideas at toolbox talks and via direct communication with Joanne or Lee. The overall effectiveness of the improvement process is checked at each management review and reflected in the ongoing revision of this quality manual.
